ABSTRACT

A survey of 60 random sugarcane fields of Srikakulam district Andhra Pradesh India was carried out in 2009-2011 to identified the weed species and their density, frequency, importance values (IV) and frequency classes of weeds. A total of 168 weed species belonging to 42 families and 130 genera were recorded. Poaceae is the largest representing 24 species, Asteraceae occupies the second position with 14 species followed by Euphorbiaceae (12), Amaranthaceae (11), Malvaceae (9), Cyperaceae (8), Fabaceae, Convolvulaceae and Commelinaceae (6) each Cleomaceae, Cucurbitaceae, Molluginaceae and Rubiaceae (5) each; Asclepiadaceae and Lamiaceae (4) each; Portulacaceae, Solanaceae, Acanthaceae and Verbenaceae (3) each; and Sterculiaceae, Tiliaceae, Lythraceae, Aizoaceae, Boraginaceae and Aristolochiaceae (2) species each. The most frequent species were found as: Parthenium hysterophorus (90%) Cyperus rotundus (76.67%); Phyllanthus amarus and Tribulus terrestris (70%) ;Kyllinga nemoralis and Cleome viscosa (65%); Cynodon dactylon and Eragrostis ciliata (63.33%). The frequency classes under A category are 93 followed by 49 under B, 16 under C, 9 under D, single species under E. So that this results showing the heterogeneity of weed vegetation.

Keywords: Weeds, Distribution, Sugarcane fields, Srikakulam

INTRODUCTION

Srikakulam the northern most part of Andhra Pradesh state lies along the East Coast of India. Srikakulam district is located within $18^{\circ} 5'$ to $19^{\circ} 12'$ N and $83^{\circ} 32'$ to $84^{\circ} 47'$ E and bounded by Orissa state on the North and bay of Bengal in the East and South East and the Vizianagaram district in the West. Weeds are unwanted plants and possess a serious threat to crop production by reducing the yield losses ranging from 10 to 75 % in several crops. Weeds differ from other plants in being more adaptive and having peculiar characteristics that make them more competitive [1]. Generally crop fields are manmade ecosystem where the desired plants are grown by stakeholders but the weeds do come up and compete with crops mainly for space, sunlight, moisture, nutrients and hence reduce the crops yield [2] The cultivated field of Srikakulam district is infested with a large number of weeds compressing heavy losses to the crop yields. It is pertinent to note that the presence of weeds in sugarcane crop implicit major losses. Weed surveys are useful for determining the occurrence and importance of weed species in crop production systems [3] Documenting the kinds of weed species and its relative distribution facilitates the establishment of priorities for research and extension services [4] A survey was conducted in North Coastal Andhra Pradesh to highlight the distribution of different weed species in all fields [5]. However, no such reference exists on the weeds of sugarcane fields from Srikakulam district. Present study has been taken up to collect the information on distribution of weeds of sugarcane fields from different areas of Srikakulam district for the first time.

MATERIAL AND METHODS

The exploration of the area under study includes the planned field trips to the various places for crop weed collection. The study was carried out during the period of 2009-2011. The random quadrat method was adopted for this study to note down the presence of the weed species in sugarcane field. After completing the weed collection from the crop fields the specimens were identified with the help of floras, Monographs 'Flora of British India' by Hooker [6] 'Flora of Presidency of Madras' by Gamble [7]; The grasses of Burma, Ceylon, India and Pakistan by Bor [8]; 'Flora of Andhra Pradesh' by [9]; and Weed flora of North Coastal Andhra Pradesh by [10] and other relevant literature.

Sugarcane (*Saccharum officinarum*) crop is a significant crop in Srikakulam district both in terms of acreage as well as productivity. Hence phytosociological studies were conducted in the crop fields. Typically sugarcane crop represents irrigated fields 'Viswamitra' variety (87A 298) of sugarcane crop with a duration of 10-12 months were selected for the phytosociological investigations. All the weeds encountered in the field sites of the above crop fields were carefully collected and identified. Random quadrat method was adopted for studying phytosociological attributes of weeds. In each field site, 20 quadrates of 100 cm^2 were laid down and hence a sum of 60 quadrates. Where taken for this study all the weeds from each quadrat were collected separately in polythene bags. All the plant species encountered in 60 quadrates were listed. Abundance, density and frequency and their relative values and Importance Value Index (IVI) were calculated by the following principles of [11-13].

Frequency (%) = $\frac{\text{Total number of quadrates in which the species occur}}{\text{Total number of quadrates studied}} \times 100$

Density = $\frac{\text{Total number of individuals of a species in all quadrates}}{\text{Total number of quadrates studied}}$

Abundance = $\frac{\text{Total number of individuals of a species in all quadrates}}{\text{Total number of quadrates in which the species occurred}}$

Relative frequency = $\frac{\text{Frequency of individuals of a species}}{\text{Total frequency of all species}} \times 100$

Relative density = $\frac{\text{Density of individuals of a species}}{\text{Total density of all species}} \times 100$

Relative abundance = $\frac{\text{Abundance of individuals of a species}}{\text{Total abundance of all species}} \times 100$

Importance Value Index = Relative density + Relative frequency + Relative abundance

The frequency classes of weed species were determined based on Raunkiaer (1934), Accordingly there are 5 frequency classes, i.e. 'A' class with the species of frequency ranging from 1-20%; 'B' class 21-40%; 'C' class 41-60%; 'D' class 61-80% and 'E' class 81-100%. Further the weed community frequency patterns were compared with the normal frequency pattern of Raunkiaer ($A>B>C>=D<E$). Based on the frequency pattern of the community, the homogeneity and heterogeneity of the vegetation. If the values are high with respect to B, C and D, then the community is said to be heterogeneous where as higher values of E indicates the homogeneous nature.

RESULTS AND DISCUSSION

A total of 168 plant species, belonging to 130 genera and 42 families were identified as sugarcane crop land weeds in the Srikakulam district . Of these 168 weed species, 136 are dicots, 32 are monocots. These species are recorded exclusively from the sugarcane crop. The total weed families recorded in the present study are 42. Out of 42, 16 are monotypic, viz., representing only by one species these are Menispermaceae, Papaveraceae, Brassicaceae, Violaceae, Zygophyllaceae, Oxalidaceae, Balsaminaceae, Sapindaceae, Caesalpiniaceae,

Mimosaceae, Passifloraceae, Apiaceae, Cuscutaceae, Pedaliaceae, Nyctaginaceae and Chenopodiaceae. Poaceae is the largest representing 24 species, Asteraceae occupies the second position with 14 species followed by Euphorbiaceae (12), Amaranthaceae (11), Malvaceae (9), Cyperaceae (8), Fabaceae, Convolvulaceae and Commelinaceae (6) each Cleomaceae, Cucurbitaceae, Molluginaceae and Rubiaceae (5) each Asclepiadaceae and Lamiaceae(4) each Portulacaceae, Solanaceae, Acanthaceae and Verbenaceae (3) each and Sterculiaceae, Tiliaceae, Lythraceae, Aizoaceae, Boraginaceae and Aristolochiaceae (2) species each. The most frequent species were found as *Parthenium hysterophorus* (90%) *Cyperus rotundus* (76.67%); *Phyllanthus amarus* and *Tribulus terrestris* (70%); *Kyllinga nemoralis* and *Cleome viscosa* (65%); *Cynodon dactylon* and *Eragrostis ciliaris* (63.33%); and *Trianthema portulacastrum*(68.33%).

Parthenium hysterophorus and *Phyllanthus amarus* had highest density with 1.4 m⁻² each followed by *Cyperus rotundus* (1.23) *Chrozophora rottleri* (1.067) *Cynodon dactylon* (1.083) *Trianthema portulacastrum* (1.033) *Tribulus terrestris* (0.9), *Cleome viscosa* (0.850) and *Croton ban-plandianum* (0.750). *Bulbostylis barbata* and *Celosia argentea* had lowest density i.e. 0.017 of each and followed by *Conyza stricta*, *Cucumis melo*, *Cuscuta reflexa*, *Euphorbia hirta*, *Ipomoea hedirifolia*, *Ocimum basilicum*, *Pavonia zeylanica*, *Pennisetum polystachyon*, *Pergularia daemia*, *Rhynchosia minima*, *Sida rhombifolia*, *Solanum surattense*, *Spermacoce pusilla*, *Talinum portulacifolium* and *Wattakaka volubilis* (0.033) each. Abundance wise *Ocimum americanum* and *Tephrosia purpurea* (4.00) *Centella asiatica* and *Impatiens balsamina* (3.00) had highest values respectively.

Parthenium hysterophorus had highest IV value of 5.870 followed by *Phyllanthus amarus* (5.549) *Cyperus rotundus* (5.211) *Trianthema portulacastrum* (4.547) *Chrozophora rottleri* (4.427) *Tribulus terrestris* (4.219) *Cynodon dactylon* (4.606) *Cleome viscosa* (3.998) *Eragrostis gangetica* (3.577) and *Croton ban-plandianum* (3.536). The lowest IV value was found in *Bulbostylis barbata* and *Celosia argentea* (0.527), *Conyza stricta*, *Cucumis melo*, *Euphorbia hirta*, *Ipomoea hedirifolia*, *Ocimum basilicum*, *Pavonia zeylanica*, *Pennisetum polystachyon*, *Pergularia daemia*, *Rhynchosia minima*, *Solanum surattense*, *Spermacoce pusilla*, *Talinum portulacifolium* and *Wattakaka volubilis* (0.604) each. The frequency classes under A category are 93 followed by 49 under B, 16 under C, 9 under D, single species under E. So that this results showing the heterogeneity of weed vegetation.

The results obtained (regarding the taxonomy of weeds in srikakulam district) from this study has clearly established the fact that the weed diversity in this region is high and significant. A thorough perusal of literature pertaining to other weed floras of different regions of Andhra Pradesh and India in general has also revealed the high concentration of weeds in this study area when compared with other areas. Pullaiah (1997) reported a total of 715 weed species in Andhra Pradesh state. Prayaga Murty (2009) has reported 532 weed species in North Coastal districts of Andhra Pradesh and 78 species were reported exclusively from sugar cane fields of Visakhapatnam, similar which are to this area also. *Cyperus rotundus*, commonly called as the ‘purplenut sedge’, is one of the prominent weed of the present study. This weed is the native of India but has become cosmopolitan, spread over most of the tropic countries, and

is treated as the world's worst weed. [14] It is one of the weeds that appear immediately after sowing and may compete heavily with the crop plants for nutrients and water.

CONCLUSION

In the present study the selected crop field of sugarcane has been well explored covering all the area of Srikakulam district. The investigator hopes that weed flora work at regional level covering the Srikakulam district would be of good source of information of technical and taxonomic data to the academic institutes and research organizations. Further this data may be useful for the Pharmaceutical and Agricultural sciences. This may be a valuable contribution for the general advancement towards the development of weed eradication and to increase the yield of crops in this area. Sugarcane has a prolonged growing season varying from 10-12months, thus effective and timely control of weeds is an important component of its management.

ACKNOWLEDGEMENT

The authors are thanks to the farmers of Srikakulam districts for their help during our field work.
